

مواد ضد عفونی حلال

تولید خالص و حلال!

روش‌های تولید و ساخت مطابق قوانین مجاز اسلامی می‌باشد.

بدون الکل بر پایه نیترات نقره!

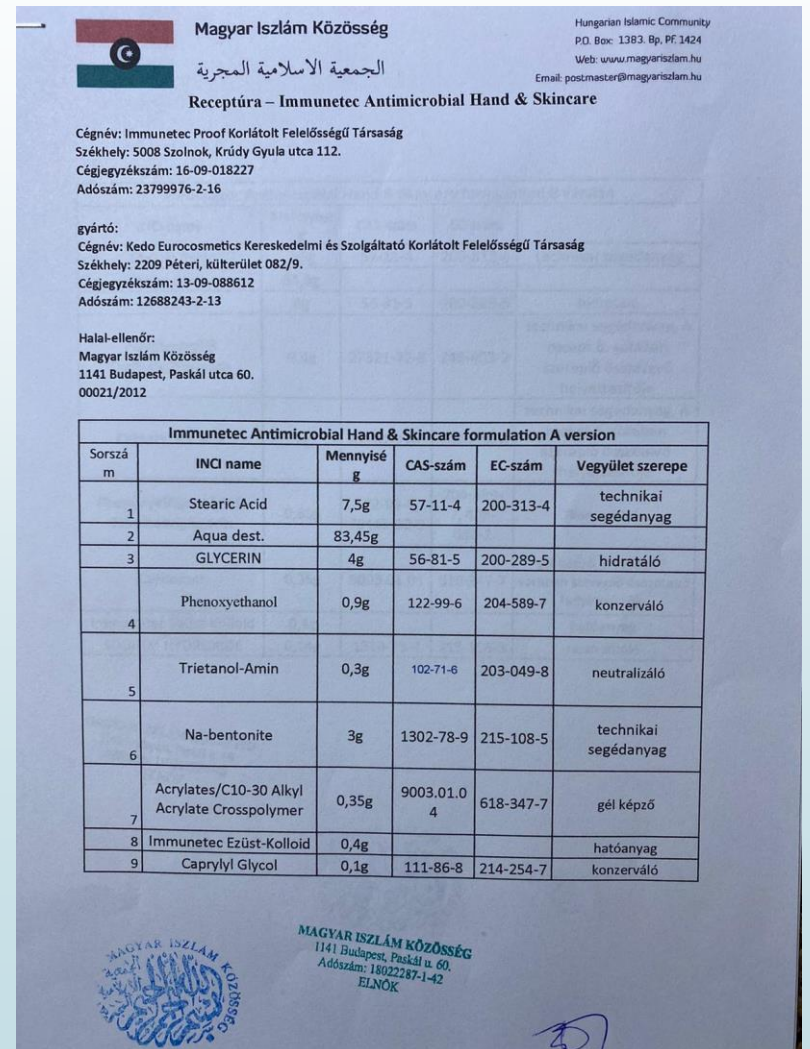

➤ **نوع محصول:** مواد ضد عفونی حلال محافظ در برابر ویروس‌ها و باکتری‌ها می‌باشد و می‌تواند به صورت مستقیم بر روی پوست بدن و پوست سر اعمال شود.

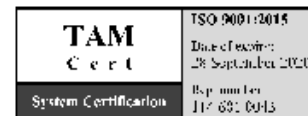

➤ **مواد تشکیل دهنده:** محلول امولسیون آبی، کرم

➤ **کاربرد:** مصارف پزشکی (حرفه‌ای) و خانگی

گواہی حلال

Expert Opinion

Applying the antimicrobial surface protection developed by [redacted] at the hospital's surgery, traumatology and septic unit has been found useful for the following reasons:

- ▶ The selected surfaces are often touched by workers, patients and visitors so their exposure to contamination may not be eliminated even by two disinfections per day.
- ▶ This technology ensures resistance to bacteria in the long term (1 treatment per year) on the following surfaces: light switches, door handles, soap and hand disinfectant dispensers, taps, toilet accessories, cupboard handles, drip stands, etc.
- ▶ The silver ions prevent the DNA reproduction and mutation of bacteria on the surfaces treated. Each silver ion involved in a reaction is replaced by a new one. Another important benefit of the product is that, by touching the treated surfaces, the silver ions kill the microorganisms on the palm and fingertips, making the skin's surface resistant (4 or 5 hours without soapy hand washing).
- ▶ Once treated, the selected surfaces need not be disinfected, only cleaned. This allows for saving one-third of disinfectants (roughly HHT 3,500) every month and spending a portion of working time on other tasks. A surface treatment of beds can increase savings.
- ▶ In direct proportion to the reduction of contaminations, there is a decrease in the number of wound infections, which in turn reduces the number of antibiotics, the chances of multiple drug resistant pathogen development, the number of reoperations and care days, the quantity of care related consumables and the length of sick leave of active wage earner patients. By lack of a probation period, on the analogy of the statistical calculation performed at the same unit during its compliance check, savings could be achieved in the use of hand disinfectants. Their value amounts to millions of forints per year.
- ▶ One week after treatment of the critical surfaces, we performed a microbiological sampling in the testing hospital without any resulting culture of bacteria or fungi. The same applies to the hand cream and the impregnation spray. The latter preserved its bacteriostatic effect (12s) after the fabric was washed.
- ▶ The National Public Health Centre's Disinfection Department tested the active agents of the products for the strains that often cause healthcare related infections and found that they prevent the reproduction of such strains.

Re: Assessment of Surface Treatment

Dear Sirs,

After your antibacterial treatment of critical surfaces (headboards, keyboards, drip stand handles, chamber pots, door handles, handrails) we performed a surface sampling.

The sampling took place one week after the surface treatment.

Microbiological findings:

Aerobic culture: none

Yeast culture: none

Re: Product Sample Test Findings

Dear Sirs,

This is to inform you about our test findings concerning the product sample received from you.

Our patient admission staff used the test sample of the **hand cream and skin cream** and we took a microbiological sample from their hands two hours later.

Microbiological findings:

Aerobic culture: none

Yeast culture: none

We performed the **antibacterial spray impregnation** on the media used in physiotherapy.

The post-impregnation sampling did not result in any culture of bacteria or fungi.

We repeated the microbiological sampling one week later with no separate disinfection in the meantime. We rinsed the media with clear water several times per day.

Microbiological findings:

Aerobic culture: none

Yeast culture: none
